

CDSVAN SOFTWARE

Multichannel Hard Disk Recorder RecControl basic

Description

RecControl is an additional powerful tool now available for CDSVAN.

The new CDSVAN Hard Disk Recording Module can digitally record up to 10 channels.

The number of channels can be set, enabling RecControl to be easily adapted to the requirements of changing conference applications.

This allows the day's conference to be easily recorded: not just spoken word from the auditorium but also the languages translated by the interpreters. For rapporteurs a speech can be divided into sequences, so-called "takes", enabling several writers to work on a contribution. This means that the minutes or manuscript as a whole can be processed quicker.

The graphical user interface is optimised by trimming it down to the really important functions, to enable the best possible overview for the user.

Features

- Continuous recording on hard disk for up to 10 channels
- Recording in mono or stereo
- Automatic and manual "Take/Cut" function
- Adjustable MP3 recording quality (64 - 320 kbits/s)
- Automatic and adjustable "Overlap" function
- Recording in MP3 or WAVE: "Version RecControl"
- Recording in WAVE: Version "RecControl Wave"
- Storing recordings in separate folders
- Twofold redundancy: back-up in the system on second hard disk/ partition and back-up in the network

System requirements

Hardware:

PC with Pentium III or higher

Software:

- Windows98SE/ME/2000/XP/Vista*
- CDSVAN 3.39.28

Optional

RecControl Wave (S5.0013)

for recording in wave data format.
